Super Mario RPG:  
Legend of the Seven Stars

**Initial expectations**

**Hey kid, you wanna  
recover some data?**

**Boy, do I!**

# The Eh-Team

- Jordan Murphy @\_ash\_matthews\_
- Paul Sorensen @PaulJSorensen
- Wayne Campbell @wcampbell42
- Me @genonullfree

Background

# First contact

## The call

- Learn more about the job
  - ~30 year old server..."some kind of Red Hat Linux"... 🚩
  - Everything's custom software written in "Advanced Basic"... 🚩
  - The previous bid they got was too high at \$50k... 🚩
  - The IT guy that quit had been the sole admin and developer for the machine and was the only one that knew how it was all setup... 🚩
- Sure thing, sounds like a job for us!

# The bid

- We're all Linux nerds, how difficult could this be?
- Estimated time: <4 months
- Bid significantly less than \$50k
- Also included a contingency that if we were unsuccessful in recovering the data, they wouldn't have to pay us anything
- Submitted the bid
- They accepted!
- High-five each other on how smart we are and how easy this will be

1

## Data Recovery

Recovery data from a Linux system

# Project: Neckbeard

# <hacker voice> We're in

- Shipped a copy of the Virtual Machine
- Gave us access to the live, production system
- RDP over VPN to a pivot machine, then telnet to the target box
- Logged into it and...

Message from user INTERnet on SRBVAX

# Wait, what's a VAX?

## Virtual Address eXtension/Virtual Memory System (VAX/VMS)

- Created by Digital Equipment Corporation (DEC) in the '70s
- VAX is the 32-bit CISC architecture
- OpenVMS (VMS) is the operating system name
- VMS is not Unix

# VAX vs VMS

## Keeping them straight

- VAX is the hardware architecture
- VMS is the operating system

A large, bold, black logo for VAX. The letters are thick and blocky, with a slight shadow effect behind them, giving it a three-dimensional appearance. The 'V' and 'A' are connected, and the 'X' is also connected to the 'A'.

<https://en.wikipedia.org/wiki/VAX>

The OpenVMS logo, featuring the word 'Open' in a white, sans-serif font, followed by 'VMS' in a larger, bold, white, sans-serif font. The 'V' in 'VMS' is particularly prominent.

<https://vmssoftware.com/products/openvms/>

# OpenVMS

DEC => Compaq => Hewlett-Packard => VMS Software Inc (VSI)

- Multi-user
- Multiprocessing
- Virtual memory
- Time sharing
- Batch processing
- Transaction processing
- Spiritual predecessor to Windows NT

Albert the Cheshire Cat

## Unknown OS: VAX/VMS

Recover data from an unknown (to us) OS:  
VAX/VMS.

2

## Data Recovery

1

Recovery data from a Linux system

Ok, so what now?

# Surveying the lay of the land

- What commands or tools exist on the system?
- What could we use to transfer the data?
- Where was the data located?
- What kind of data are we looking to recover?

# Some VMS commands

## DIGITAL Command Language (DCL)

- VMS / Unix command comparisons:
  - <https://www3.physnet.uni-hamburg.de/physnet/vms-unix-commands.html>
- Most commands we were not familiar with or never heard of except for...

VMS	*NIX
SET DEFAULT [DIR]	cd [dir]
TYPE [FILE]	cat [file]
SHOW PROCESSES /ALL	ps -l
DIRECTORY	ls
SEARCH	grep

**FTP to the rescue!**

# Just FTP the files off!

- Setup a userspace FileZilla FTP server on the pivot box
- Recursively send files back to it
- High-five each other on how smart we are and how easy this was

A few GB later...

# “Just” FTP the files off

- ERROR: Not enough disk space on the pivot machine to host the data
- Disallowed to:
  - Attach a USB drive
  - Add another HDD
  - Disrupt production server

# Booting up the VM

Uh...wut

# Advanced Virtualization Technologies

“Modernize Without Making Changes”

- Run on modern hardware (X86)
- Run on virtual machines (VMware, Hyper-V, KVM, XEN)
- Use the latest storage technologies
- Consolidate multiple VAX and Alpha systems on a single host
- Build installations that are disaster resilient
- Run in the cloud
- Keep your processes as they were

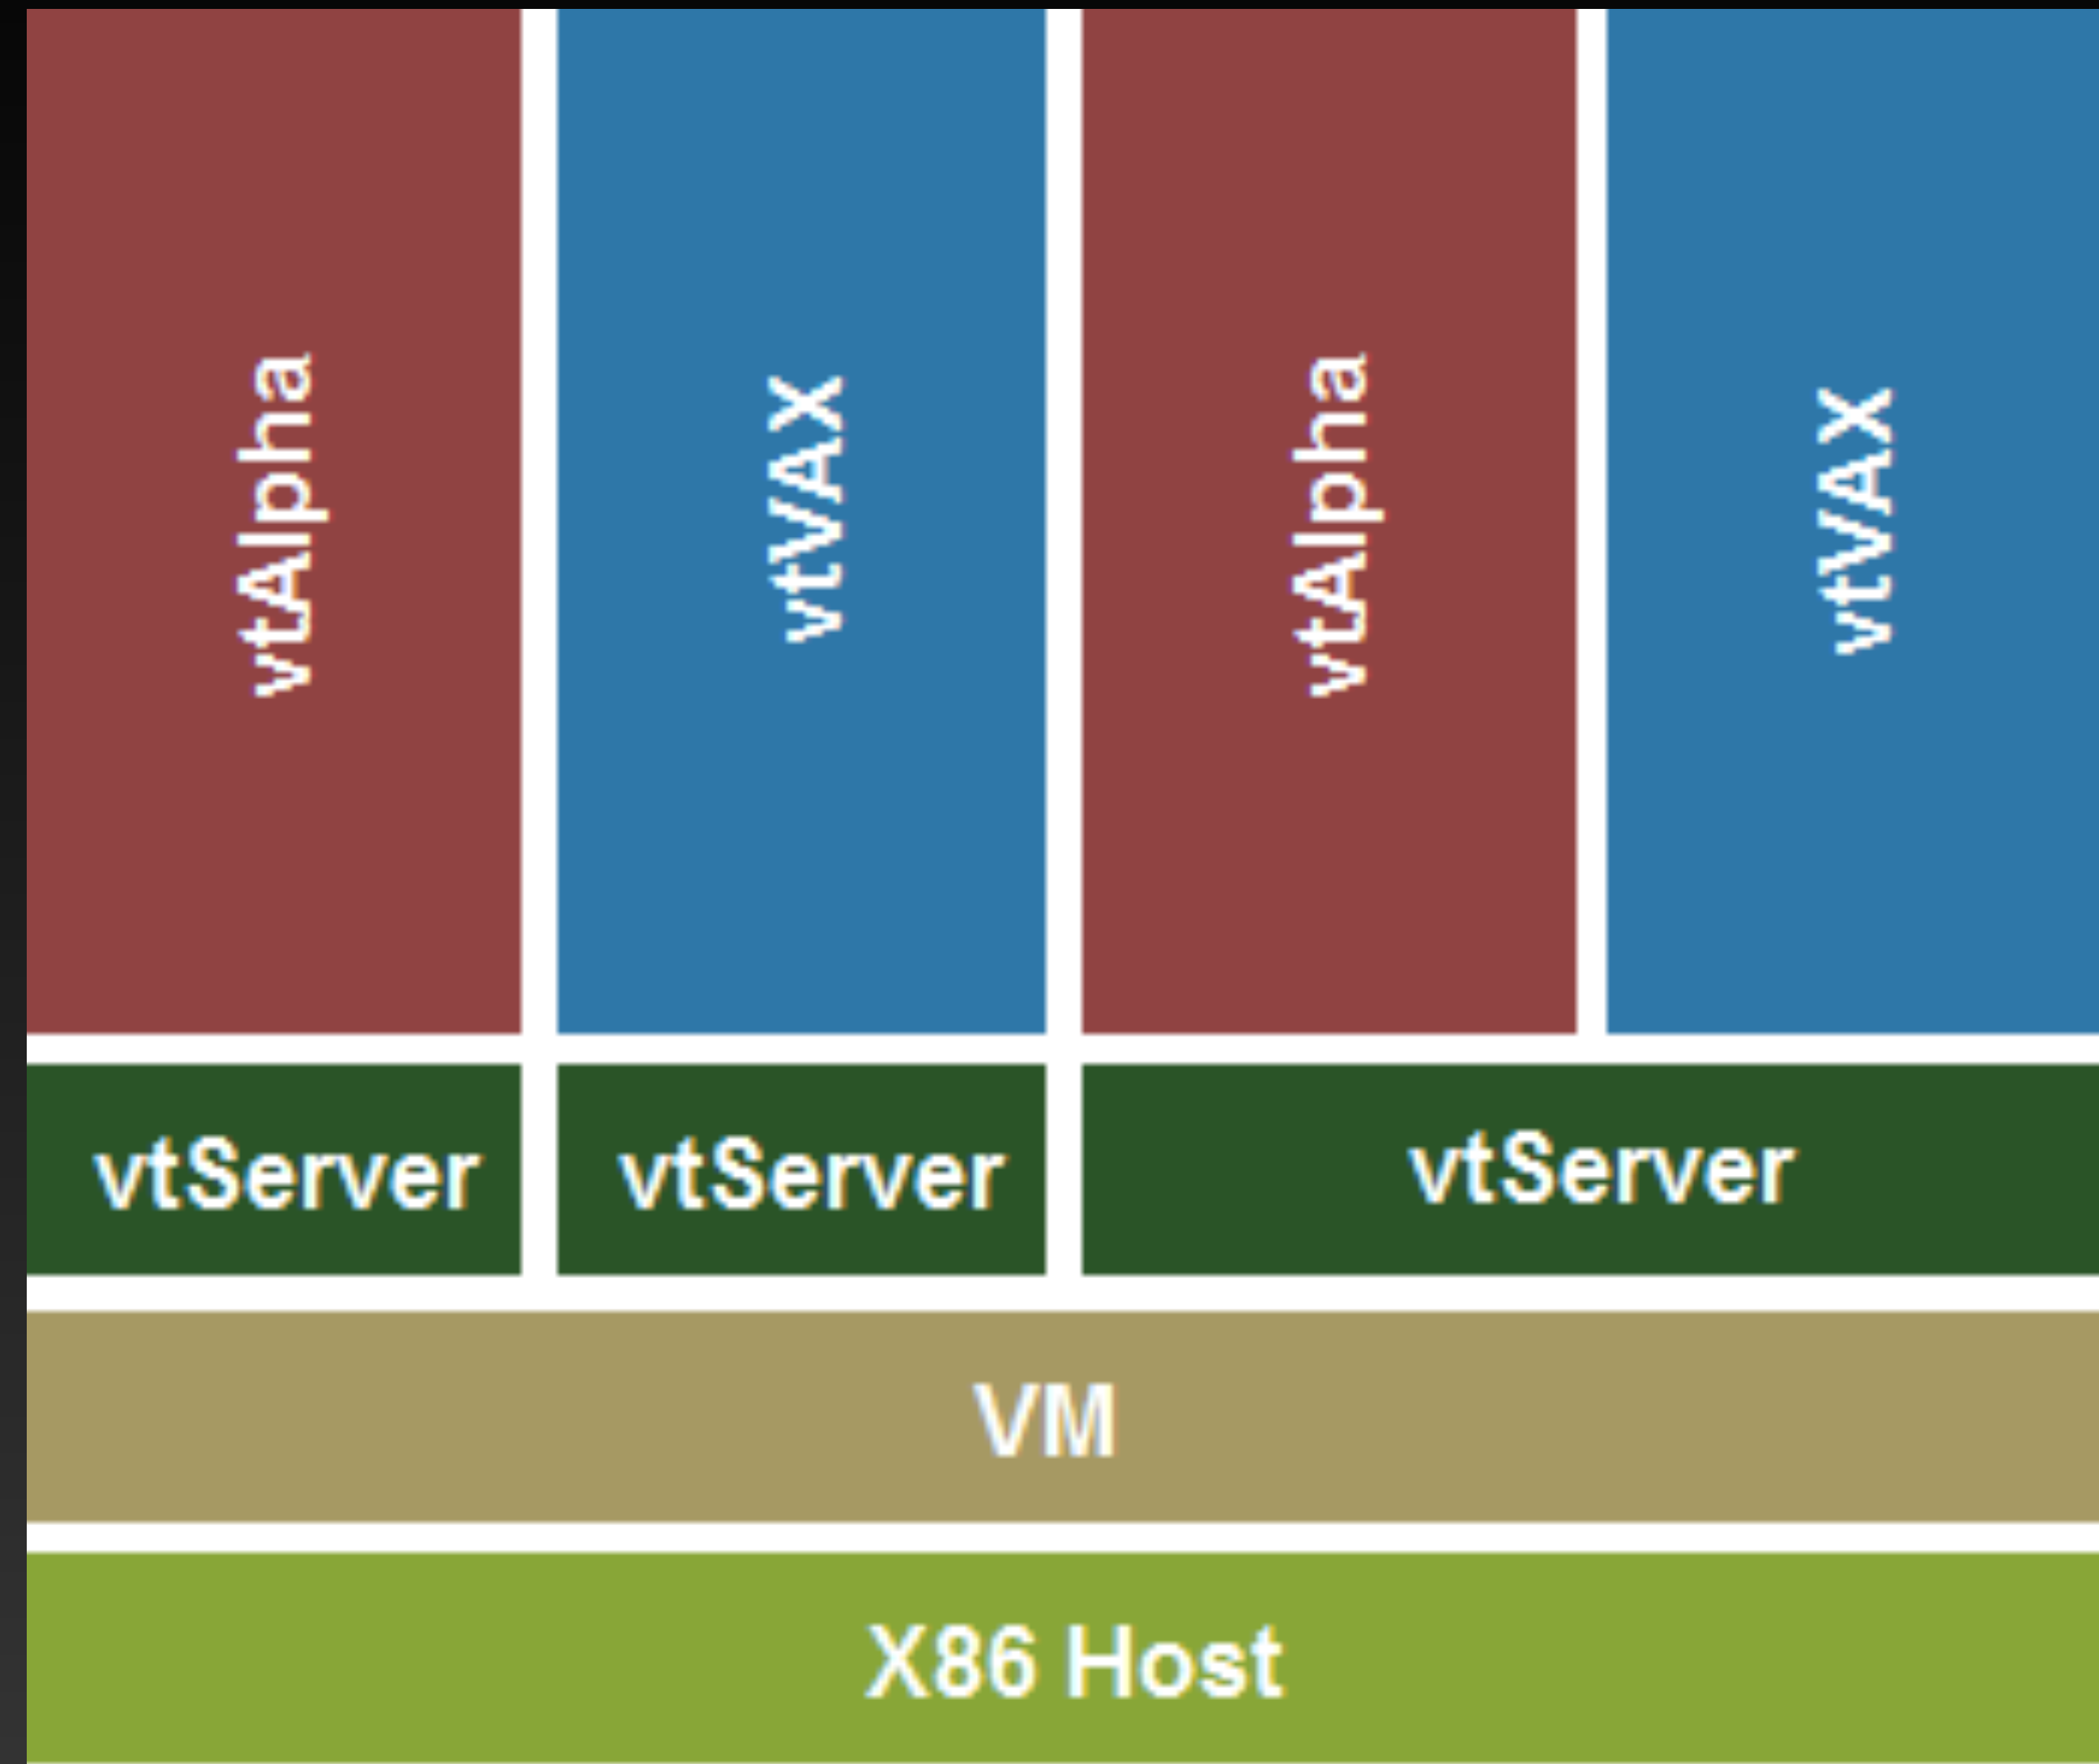

Advanced Virtualization Technologies

<https://www.avtware.com/>

# Server configuration

- vtVAX running in an AVT VM
- AVT VM running on x86 host

# archlinux™

A simple, lightweight linux distribution.

## Arch Linux

Arch Linux install medium (x86\_64, BIOS)

Arch Linux install medium (x86\_64, BIOS) with speech

Arch Linux install medium (x86\_64, BIOS, Copy to RAM)

Boot existing OS

Run Memtest86+ (RAM test)

Hardware Information (HDT)

Reboot

Press [Tab] to edit options

Boot the Arch Linux install medium on BIOS.

It allows you to install Arch Linux or perform system maintenance.

Automatic boot in 7 seconds...

Arch Linux 5.17.5-arch1-1 (tty1)

archiso login: root (automatic login)

To install Arch Linux follow the installation guide:  
[https://wiki.archlinux.org/title/Installation\\_guide](https://wiki.archlinux.org/title/Installation_guide)

For Wi-Fi, authenticate to the wireless network using the `iwctl` utility.  
For mobile broadband (WWAN) modems, connect with the `mmcli` utility.  
Ethernet, WLAN and WWAN interfaces using DHCP should work automatically.

After connecting to the internet, the installation guide can be accessed  
via the convenience script `Installation_guide`.

```

# Not so fast, buckaroo

- AVT requires a license :(
- No USB license fob was given for our VM clone
  - In use on their production VM

# Investigating the Licensing

# License checker

- Identify the binary responsible for validating the USB key fob
- Moment of truth, do we decide to hunker down and do some RE or...?

## Unknown OS: VAX/VMS

Recover data from an unknown (to us) OS:  
VAX/VMS.

2

## Data Recovery

1

Recovery data from a Linux system

## VM within a VM

3

Recover data from a licensed-locked  
VAX/VMS emulated within a Linux VM.

**Surely there's a ~~better~~ easier  
way**

# Continuing to investigate the system...

- We've located the virtual hard disks
- Copy the virtual disks off
- Try to mount them on our linux host
  - Of course that doesn't work

# Emulation!

After all, it's what they're doing

- There are several VAX emulators to choose from
  - SIMH
  - VAX MP
  - FreeAXP
  - Charon-AXP (Alpha)
  - ...others?

# Success...ish!

- Able to boot the VMS image!
- Unable to mount the data drives
  - Disks identify as a RAID5/6
  - No idea how to create / mount RAID drives in OpenVMS
  - Emulator we used had more configuration that we knew how to use

```
root@archiso /mnt # file b/dkd0.vdisk
```

```
b/dkd0.vdisk: Files-11 On-Disk Structure (ODS-2); VAX/VMS or OpenVMS file system; volume label is 'A  
XPVMSSYS'
```

```
root@archiso /mnt # _
```

```
root@archiso /mnt # file b/dkd0.vdisk
b/dkd0.vdisk: Files-11 On-Disk Structure (ODS-2); VAX/VMS or OpenVMS file system; volume label is 'A
XPUMSSYS'
root@archiso /mnt # mkdir tmp
root@archiso /mnt # mount b/dkd0.vdisk tmp
mount: /mnt/tmp: wrong fs type, bad option, bad superblock on /dev/loop1, missing codepage or helper
program, or other error.
        dmesg(1) may have more information after failed mount system call.
32 root@archiso /mnt # _
```

# Mounting the drives with ods2util

# Loop device

## `losetup`

- tl;dr:
  - A loop device makes a file look like a hard drive
- Longer:
  - A loop device maps a file to a block device so it can be accessed as if it were a block device
- Thorough:
  - `man loop`

# Setup the disk image as a loop device

```
$ sudo losetup -f vmimage.vdisk
```

```
$ sudo losetup
```

NAME	SIZELIMIT	OFFSET	AUTOCLEAR	RO	BACK-FILE	DIO	LOG-SEC
/dev/loop1	0	0	1	1	/var/lib/snapd/snaps/core_11420.snap	0	512
<b>/dev/loop4</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>/data/_data/nolacon-2022-neckbeard-talk/ods2util/vmimage.vdisk</b>	<b>0</b>	<b>512</b>
/dev/loop2	0	0	1	1	/var/lib/snapd/snaps/core18_2074.snap	0	512
/dev/loop0	0	0	1	1	/var/lib/snapd/snaps/core18_2066.snap	0	512
/dev/loop3	0	0	1	1	/var/lib/snapd/snaps/core_11316.snap	0	512

# ods2

```
$ sudo ./ods2 mount loop4
```

```
ODS2 V1.3hb
```

```
%MOUNT-I-MOUNTED, Volume VAXVMS047A    mounted on loop4:
```

## Data Recovery

Recovery data from a Linux system

## Unknown OS: VAX/VMS

Recover data from an unknown (to us) OS:  
VAX/VMS.

## VM within a VM

Recover data from a licensed-locked  
VAX/VMS emulated within a Linux VM.

## Mount ODS-2 FS

Recover data from RAID disk images.

**What if there's an easier way still**

# Use the ods5fs LKM

At least this way we don't have to compile it ourselves

- Lets just use the pre-built TinyCore image we found on the internet with the LKM already loaded!
- Source code for ods5fs has not been released by the author :(
- [www.vms2linux.de/TC-remastered.iso](http://www.vms2linux.de/TC-remastered.iso)

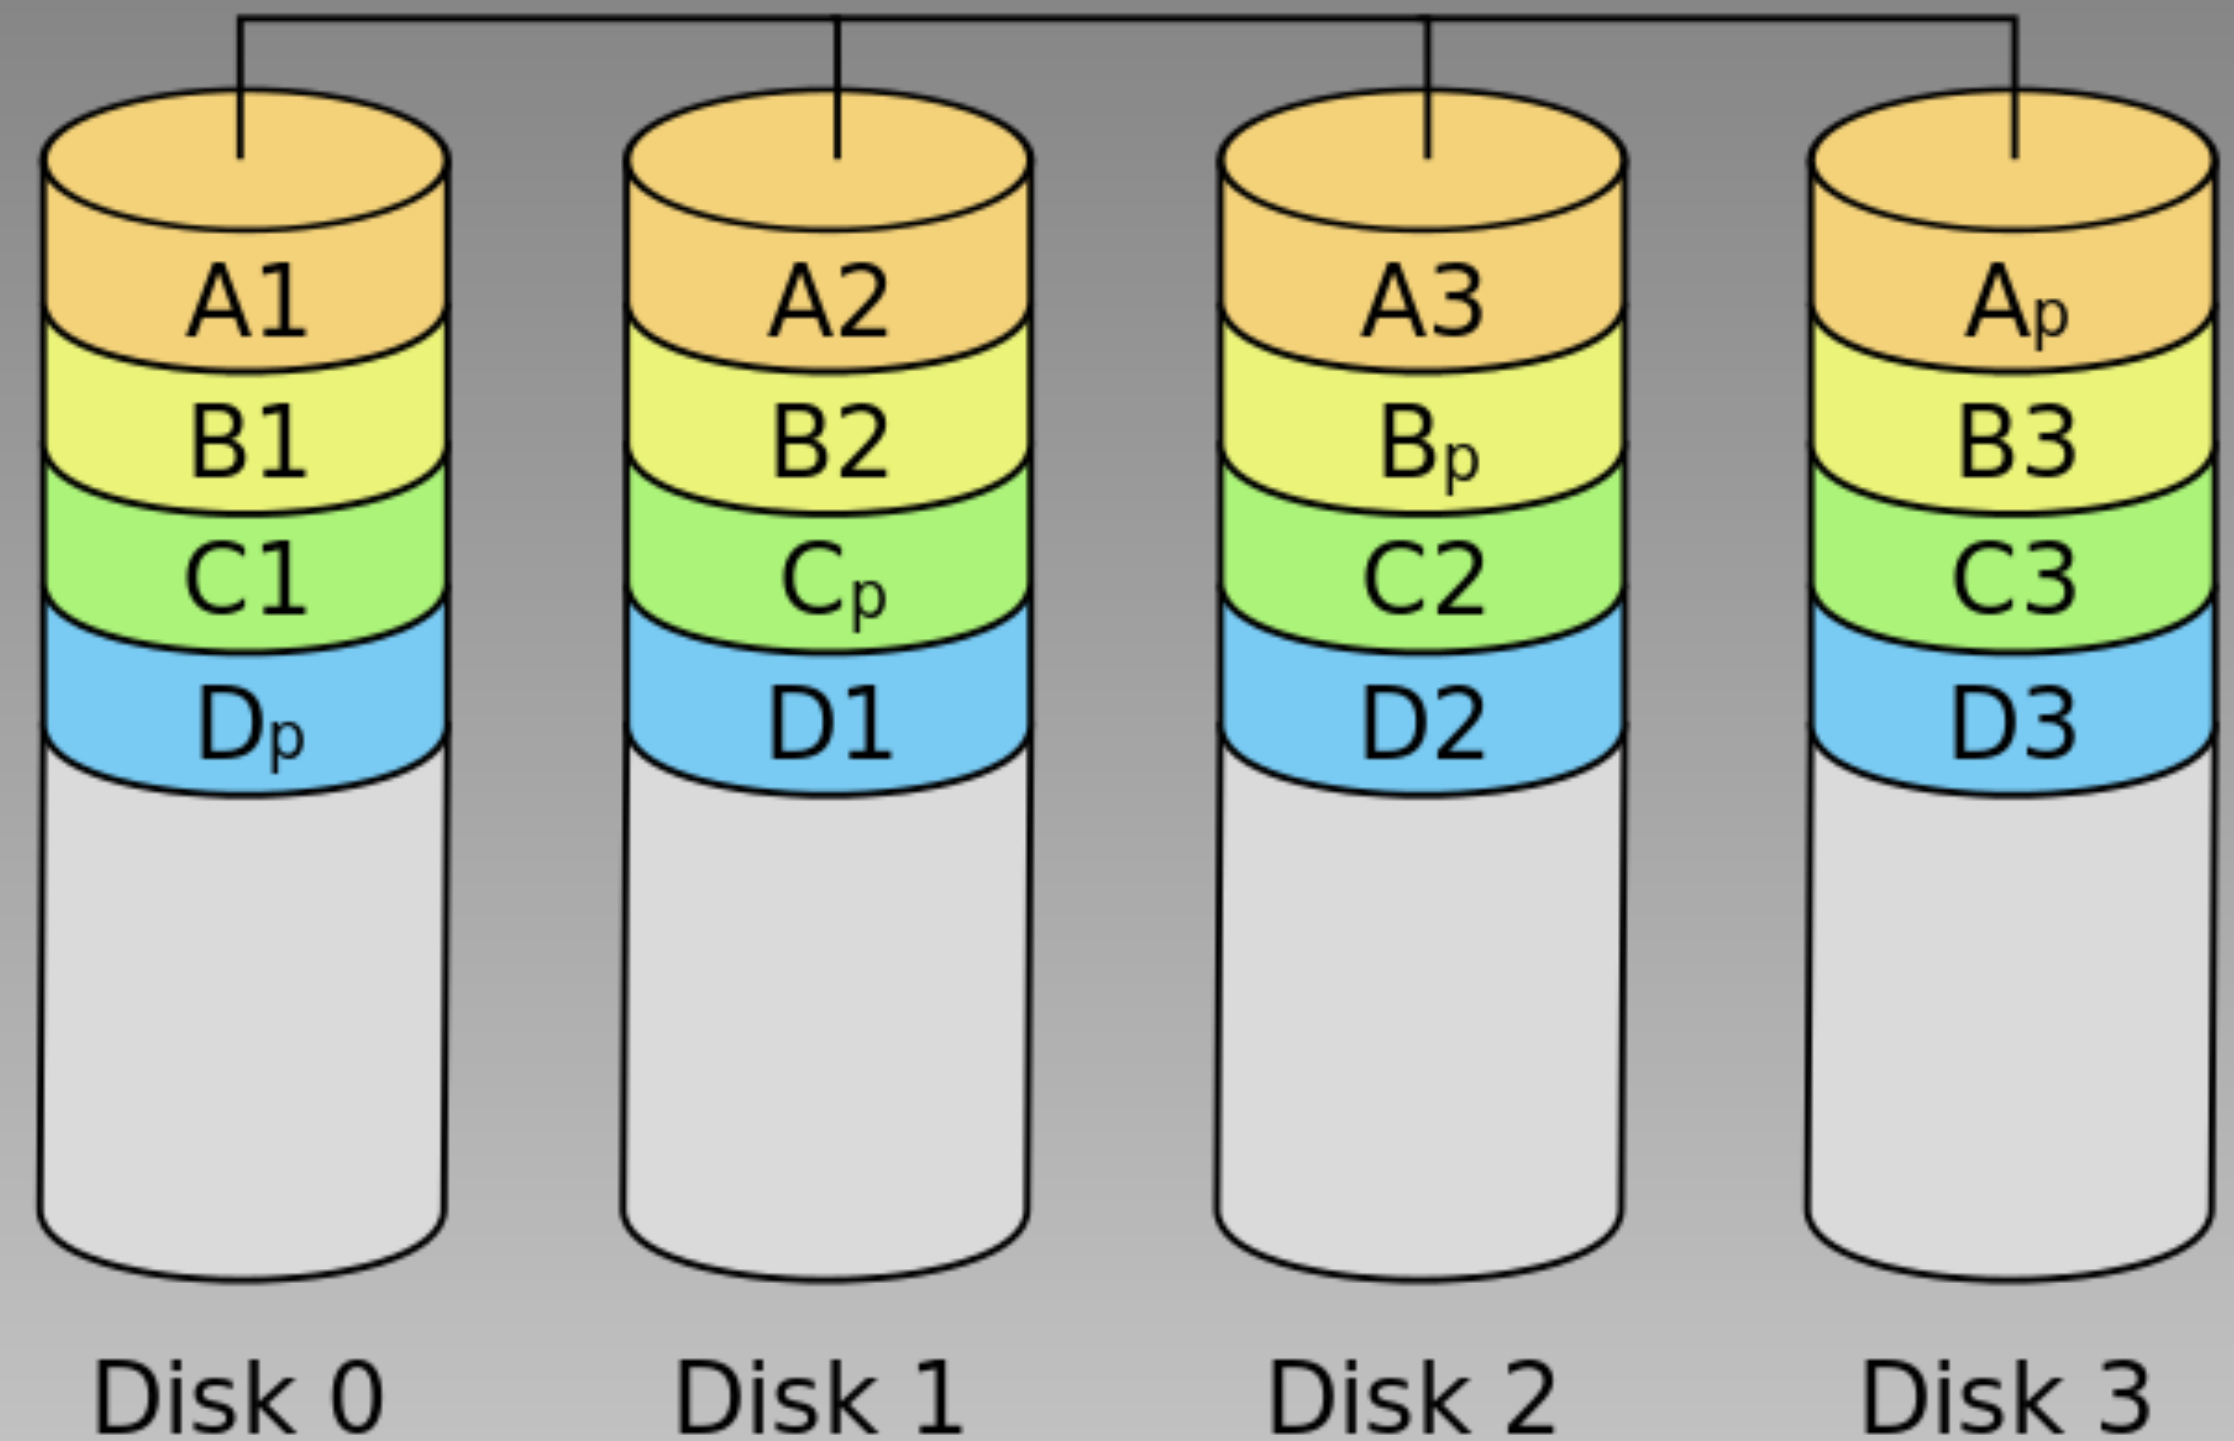

# RAID

“Redundant Array of Independent Disks”

- RAID “levels”:

- RAID 0
- RAID 1
- RAID 5
- RAID 6
- RAID 10
- RAID 50
- Etc...

## RAID 5

# This RAID is weird, m'kay

- Non-standard RAID, possibly “Declustered Raid”
  - [https://en.wikipedia.org/wiki/Non-standard\\_RAID\\_levels#Declustered\\_RAID](https://en.wikipedia.org/wiki/Non-standard_RAID_levels#Declustered_RAID)
- With ods5fs we were able to mount each RAID member separately, and copy off complete files

```
tc@box:~$ sudo losetup -f example.vdisk
tc@box:~$ losetup -a
/dev/loop0: 0 example.vdisk
tc@box:~$
```

# Terminal

```
tc@box:~$ sudo mount /dev/loop0 ex
```

```
tc@box:~$ sudo ls ex
```

**FINALLY! Data extraction**

High-five each other on how smart we are and how easy this was

# Types of Data Recovered

- This particular VAX/VMS was apparently used for at least:
  - County Payroll
  - Jury / Jail / Juvenile Detention
  - Sewer / Billing
  - Title Records

# Copying data

- Copy each disk image separately
- Raw disk images take up ~2TB
- 3,553,517 individual files
- Extracted data takes up 290GB

```
JURY.DIR;1/DAT.DIR;1/BEFORE_ITANIUM.DIR;1/MASTER.JR;1' -> '/mnt/sdb1/dkd100/JURY.DIR;1/DAT.DI
JURY.DIR;1/DAT.DIR;1/BEFORE_ITANIUM.DIR;1/MESSAG.JR;1' -> '/mnt/sdb1/dkd100/JURY.DIR;1/DAT.DI

**Worked great!**

Until it didn't...

**Taking a step back**

# ODS-2 Filesystem

## Records Management Services

- Provides interface (API) to interact with the underlying filesystem
  - Get (read)
  - Find
  - Put (write)
  - Update
  - Delete

# ODS-2

## Record Formats

- Fixed
- Stream / Stream\_CR / Stream\_LF
- Undefined
- Variable

# Bingo!

## Variable Record Format

**VARIABLE:** The data portion of each record is preceded with a 2-byte binary count field that specifies the length of the record in bytes, excluding the byte field itself. Each new record begins on an even byte (WORD aligned). A null character is appended to the end of the previous record if necessary so the next record will begin on a padded boundary.

## Data Recovery

1

Recovery data from a Linux system

## Unknown OS: VAX/VMS

2

Recover data from an unknown (to us) OS:  
VAX/VMS.

## VM within a VM

3

Recover data from a licensed-locked  
VAX/VMS emulated within a Linux VM.

## Mount ODS-2 FS

4

Recover data from RAID disk images.

## Clean up extracted data

5

Convert the data from the Variable record  
format to Undefined (i.e. stream of bytes)

# Vaxuum all the things!

- Add in the extra null-padding logic
- And we're off!

# 100% complete

High-five each other on how smart we are and how easy this was

# Lessons Learned

# Compensation

- Don't be afraid to renegotiate a contract when project-altering information is discovered
- Don't underbid yourself
  - Know your worth and the going rate for the type of work
  - We underestimated the effort involved by at least 4x

# Documentation

- Document:
  - Every piece of software
  - Every command
- If at first you don't succeed, document it anyway

when u revisit a function  
u wrote months ago and  
now it makes no sense and  
there is no documentation

# Communication

- Don't use Signal for project-related communications
  - Use something like keybase.io for better long-term chat history
- Be as upfront with the customer as possible about requirements, expectations, and contract negotiations

# Tool List

- Rmlint - <https://github.com/sahib/rmlint>
- keybase.io - <https://keybase.io/>
- Ods2fs - <http://www.vms2linux.de/ods2util.html>
- Ods5fs - <http://www.vms2linux.de/TC-remastered.iso>
- Vaxuum - <https://github.com/genonullfree/vaxuum>
